## Features

Page	
	– Nominal pressure 280 bar
	– Slide bearings for heavy duty applications
	– Drive shafts to ISO or SAE
	– Combination of several pumps possible
	– Line ports:
	connection flange or screw thread
	– Consistent high quality thru mass production
	– Numerous configuration variants available

# General

Rexroth external gear pumps are available as standard gear pumps in the 4 series of B, F, N and G and as SILENCE gear pumps in the series of S, T and U, in which the displacements are graded by different gear widths. Further configuration variants are given by different flanges, shafts, valve arrangements and multiple pump combinations.

## Construction

The external gear pump consists essentially of a pair of gears supported in bearing bushings and the case with a front and a rear cover. The drive shaft protrudes from the front cover where it is sealed by the shaft seal ring. The bearing forces are absorbed by special bearing bushings with sufficient elasticity to produce surface contact instead of line contact. They also ensure excellent resistance to galling – especially at low speed. The gears have 12 teeth. This keeps both flow pulsation and noise emission to a minimum.

The internal sealing is achieved by forces which are proportional to delivery pressure. This ensures optimum efficiency. The bearings provide the seal at the ends of the gaps between the teeth which carry the pressurized oil. The sealing zone between the gear teeth and the bearing is controlled by the admission of operating pressure to the rear of the bearing bushings. Special seals form the boundary of the zone. The radial clearance at the tips of the gear teeth is sealed by internal forces pushing them against the case.

### Gear pump axial compensation

# Gear pumps with integral valves

In order to reduce external pipework it is possible to incorporate a flow-control valve or pressure-relief valve in the rear supply of the gear pump. A typical application of this is in the supply of hydraulic oil in power steering systems. The pump delivers a constant flow irrespective of the speed at which it is driven. The excess flow is either returned internally to the suction port or distributed externally to other items of equipment.

3-way flow-control valve.  
Excess flow returned to suction line  
 $Q_{const.} = 2...30 \text{ l/min}$

3-way flow-control valve.  
Excess flow distributed externally; loadable  
 $Q_{const.} = 2...30 \text{ l/min}$

3-way flow-control valve with pressure-relief valve.  
Excess flow returned to suction line  
 $Q_{const.} = 2...30 \text{ l/min}$   
 $p_1 = 100...180 \text{ bar}$

Pressure-relief valve.  
Discharge returned to suction line  
 $p_1 = 5...250 \text{ bar}$

# Design calculations for pumps

The design calculations for pumps are based on the following parameters:

- $V$  [ $\text{cm}^3/\text{rev}$ ] Displacement
- $Q$  [ $\text{l}/\text{min}$ ] Delivery
- $p$  [ $\text{bar}$ ] Pressure
- $M$  [ $\text{Nm}$ ] Drive torque
- $n$  [ $\text{rev}/\text{min}$ ] Drive speed
- $P$  [ $\text{kW}$ ] Drive power

It is also necessary to allow for different efficiencies such as:

- $\eta_v$  Volumetric efficiency
- $\eta_{hm}$  Hydraulic-mechanical efficiency
- $\eta_t$  Overall efficiency

The following formulas describe the various relationships.

They include correction factors for adapting the parameters to the usual units encountered in practice.

**Caution:** Diagrams providing approximate selection data will be found on subsequent pages.

$$Q = V \cdot n \cdot \eta_v \cdot 10^{-5}$$

$$p = \frac{M \cdot \eta_{hm}}{1.59 \cdot V}$$

$$P = \frac{p \cdot Q}{6 \cdot \eta_t}$$

$$V = \frac{Q}{n \cdot \eta_v} \cdot 10^5$$

$$V = \frac{M \cdot \eta_{hm}}{159 \cdot p}$$

$$Q = \frac{6 \cdot P \cdot \eta_t}{p}$$

$$n = \frac{Q}{V \cdot \eta_v} \cdot 10^5$$

$$M = \frac{1.59 \cdot V \cdot p}{\eta_{hm}}$$

$$p = \frac{6 \cdot P \cdot \eta_t}{Q}$$

[%]

$n$  —  $\eta_v$  —  $Q$       $V$  [ $\text{cm}^3/\text{rev}$ ]    $Q$  [ $\text{l}/\text{min}$ ]    $p$  [ $\text{bar}$ ]

$M$  —  $\eta_{hm}$  —  $p$

$P$  —  $\eta_t$  —  $P \cdot Q$       $n$  [ $\text{rev}/\text{min}$ ]    $P$  [ $\text{kW}$ ]    $M$  [ $\text{Nm}$ ]

**Caution:**  $\eta$  [%] e.g. 95 [%]

# Performance charts

$\nu = 32 \text{ mm}^2/\text{s}, \vartheta = 50^\circ\text{C}$

$Q = f(n, V)$  incl.  $\eta_v$   
 $P = f(n, p)$  ——— incl.  $\eta_t$   
 $M = f(n, p)$  - - - incl.  $\eta_{hm}$

Performance charts (continued)

# Noise charts

**Noise level** dependent on rotational speed, pressure range between 10 bar and pressure value  $p_2$  (see page 16 Specifications table).

Oil data:  $\nu = 32 \text{ mm}^2/\text{s}$ ,  $\vartheta = 50^\circ\text{C}$ .

Sound pressure level calculated from noise measurements made in the sound absorbent measuring room compliant with DIN 45 635, Part 26.

Spacing between measuring sensor – pump: 1 m.

These are typical characteristic values for the respective model. They describe the airborne sound emitted solely by the pump. Environmental influences (installation site, piping, further system components) are not taken into consideration. Each value applies for a single pump.

Noise charts (continued)

# Specification

General	
Construction	External gear pump
Mounting	Flange or through-bolting with spigot
Line ports	Screw, flange
Direction of rotation (looking on shaft)	Clockwise or counter-clockwise, the pump may only be driven in the direction indicated
Installation position	Any
Load on shaft	Radial and axial forces after consulting
Ambient temperature range	-30°C...+80°C or max. 110°C with FKM seal
Hydraulic fluid	- Mineral oil compliant with DIN 51 524, 1-3, however under higher load at least HLP compliant with DIN 51 524 Part 2 recommended. - Comply with RE 90220 - Further operating fluids possible after consultation
Viscosity	12...800 mm <sup>2</sup> /s permitted range 20...100 mm <sup>2</sup> /s recommended range ...2000 mm <sup>2</sup> /s range permitted for starting
Hydraulic fluid temperature range	max. +80°C with NBR seals*) max. +110°C with FKM seals**)
Filtration ***)	At least cleanliness level 20/18/15 compliant with ISO 4406 (1999)

\*) NBR = Perbunan®  
 \*\*) FKM = Viton®  
 \*\*\*) During the application of control systems or devices with critical counter-reaction, such as steering and brake valves, the type of filtration selected must be adapted to the sensitivity of these devices/systems.

Safety requirements pertaining to the whole systems are to be observed.

In the case of applications with high numbers of load cycles please consulting.

## Definition of direction of rotation

Always look on the drive shaft.

**Caution:** Dimensions drawings always show clockwise-rotation pumps. On counter-clockwise-rotation pumps the positions of the drive shaft and the suction and pressure ports are different.

## Definitions of pressures

$p_1$  max. continuous pressure  
 $p_2$  max. intermittent pressure  
 $p_3$  max. peak pressure

### AZPF-1x

# Drive arrangements

## 1. Flexible couplings

The coupling must not transfer any radial or axial forces to the pump.

The maximum radial runout of shaft spigot is 0.2 mm.

Refer to the fitting instructions provided by the coupling manufacturer for details of the maximum permitted shaft misalignment.

## 2. Coupling sleeve

Used on shafts with DIN or SAE splining. Caution: There must be no radial or axial forces exerted on the pump shaft or coupling sleeve. The coupling sleeve must be free to move axially. The distance between the pump shaft and drive shaft must be  $2^{+1}$ . Oil-bath or oil-mist lubrications is necessary.

Splined shaft	$M_{max}$ [Nm]	$V$ [cm <sup>3</sup> /rev]	$p_{max}$ [bar]
DIN	100	4...28	$p_{max}$
SAE 9t	110		
SAE 11t	180		

## 3. Drive shaft with tang

For the close-coupling of the pumps to electric motor or internal-combustion engine, gear, etc. The pump shaft has a special tang and driver ③ (not included in supply). There is no shaft sealing.

The recommended arrangements and dimensions for the drive end and sealing are as follows.

### ① Drive shaft

Case-hardening steel DIN 17 210  
e.g. 20 MnCrS 5  
case-hardened 0.6 deep; HRC 60 ±3.  
Surface for sealing ring  
ground without rifling  $R_{max.} \leq 4\mu\text{m}$

### ② Radial shaft seal ring

Rubber-covered seal (see DIN 3760, Type AS or double-lipped ring).  
Cut 15° chamfer or fit shaft seal ring with protection sleeve.

## Drive with tang

### AZPF-1x

$M_{max.}$ [Nm]	$V$ [cm <sup>3</sup> /rev]	$p_{max.}$ [bar]
65	4...14	280
	16	230
65	19	190
	22.5	160

### AZPF-2x

$M_{max.}$ [Nm]	$V$ [cm <sup>3</sup> /rev]	$p_{max.}$ [bar]
85	4...14	280
	16	280
85	19	250
	22.5	210
	25	190
	28	170

**4. V-belts and straight gearwheels or helical toothed gear drives without outboard bearing**

When proposing to use V-belt or gear drive, please submit details of the application for our comments (especially dimensions  $a$ ,  $d_m$ ,  $d_w$  and angle  $\alpha$ ). For helical toothed gear drives, details of the helix angle  $\beta$  are also required.

**5. Outboard bearing**

Outboard bearing eliminate possible problems when the pumps are driven by V-belts or gearwheels. The diagrams below show the maximum radial and axial loads that can be tolerated based on a bearing life of  $L_H = 1000$  hours.

$M_{max.}$ [Nm]	$V$ [cm <sup>3</sup> /rev]	$p_{max.}$ [bar]
65	16	230
	19	190
	22.5	160

# Multiple gear pumps

Gear pumps are well-suited to tandem combinations of pumps in which the drive shaft of the first pump is extended to drive a second pump and sometimes a third pump in the same manner. A coupling is fitted between each pair of pumps. In most cases each pump is isolated from its neighbor, i.e. the suction ports are separate from one another. A common suction port is also possible as an option.

**Caution:** Basically, the specifications for the single pumps apply, but with certain restrictions:

**Max. speed:** This is determined by the highest rated pump speed in use.

**Pressures:** These are restricted by the strength of the drive shaft, the through drives and the drivers. Appropriate data is given in the dimensional drawings.

### Pressure restrictions during standard through drive

In the case of series S, the driver for the second pumping stage can carry a load of up to  $M_{max.} = 65 \text{ Nm}$ , i.e. there is a pressure restriction for the second stage and any further stages.

$M_{max.}$ [Nm]	$V$ [cm <sup>3</sup> /rev]	$p_{max.}$ [bar]
65	16	230
	19	190
	22.5	160
	25	140
	28	130

If the first stage is driven through a tang (driver) or outboard bearing type 1, pressure restrictions apply as indicated in the formula below.

Reinforced through drives are available for applications with higher transfer torques and/or rotational vibrations. Customized designs available on request.

### Reinforced through drive

### Standard through drive

### Combinations

Series pump 1	$M_{max.}$ [Nm]	Series pump 2
F	65	F
F	65	S
F	12	B

### Max. transferrable drive torque \*

Function	Code letter	Designation	Max. transferrable drive torque * [Nm]
Spined shafts	R	SAE J744 16-4 9T	110
	P	SAE J744 19-4-11T	180
Tapered key shaft	C	1:5	155
	H	1:8	160
Cylinder shafts	G	Shafts Ø 15.875	55
	A	Shafts Ø 18	75
Claw	N	Dihedral claw	65

\* These values only apply when the conditions described on page 16 are complied with. Bosch Rexroth is to be consulted if the stated values are exceeded.

$$M_{max.} \cong \Delta p_1 \cdot V_1 \cdot 0.0177 + \Delta p_2 \cdot V_2 \cdot 0.0177 + \Delta p_3 \cdot V_3 \cdot 0.0177$$

# Notes for commissioning

## Filter recommendation

The major share of premature failures in external gear pumps is caused by contaminated hydraulic fluid.

As a warranty cannot be issued for dirt-specific wear, we recommend filtration compliant with cleanliness level 20/18/15 ISO 4406, which reduces the degree of contamination to a permissible dimension in terms of the size and concentration of dirt particles:

Operating pressure [bar ]	>160	<160
Contamination class ISO 4406	18/15	19/16
To be reached with $\beta_x = 75$	20	25

We recommend that a full-flow filter always be used. Basic contamination of the hydraulic fluid used may not exceed class 20/18/15 according to ISO 4406. Experience has shown that new fluid quite often lies above this value. In such instances a filling device with special filter should be used.

## General

- The pumps supplied by us have been checked for function and performance. No modifications of any kind may be made to the pumps; any such changes will render the warranty null and void!
- Pump may only be operated in compliance with permitted data (see pages 15 – 18).

## Project planning notes

Comprehensive notes and suggestions are available in Hydraulics Trainer, Volume 3 RE 00 281, "Project planning notes and design of hydraulic systems". Where external gear pumps are used we recommend that the following note be adhered to.

## Technical data

All stated technical data is dependent on production tolerances and is valid for specific marginal conditions.

Note that, as a consequence, scattering is possible, and at certain marginal conditions (e.g. viscosity) **the technical data may change**.

## Characteristics

When designing the external gear pump, note the maximum possible service data based on the characteristics displayed on pages 10 to 12.

Additional information on the proper handling of hydraulic products from Bosch Rexroth is available in our document: "General product information for hydraulic products" RE 07 008.

## Contained in delivery

The components with characteristics as described under ordering code and device measurements, pages 20 – 58, are contained in delivery.

**You can find further information in our publication: "General Operating Instructions for External Gear Units" RE 07 012-B1.**

## The AZ configurator at [www.boschrexroth.com/azconfigurator](http://www.boschrexroth.com/azconfigurator)

The AZ configurator assists you to configure your individual external gear unit easily and user-friendly. You only need to specify your requirements: From the displacement, direction of rotation, drive shaft, connection flange right up to the required rear cover. You immediately receive a project drawing (PDF format) if a configuration already exists. You receive the price of the configured external gear unit upon request.

The AZ configurator assists you to configure your individual external gear unit easily and user-friendly – all data needed for project planning are acquired thru menu guidance.

Selection is made either on an ordering code or your technical requirements. This means that you can search for external gear units that have already been configured, or you specify the configuration variant of the external gear unit based upon the operating parameters you require.

If the external gear unit you selected has been released you will receive the part number, ordering code and a detailed installation drawing. If your special configuration is not available please send your specification to Rexroth. One of our employees will then contact you.
